

Sulaiman Kaleel – ITMO-444 AWS Account Setup

1.

2.

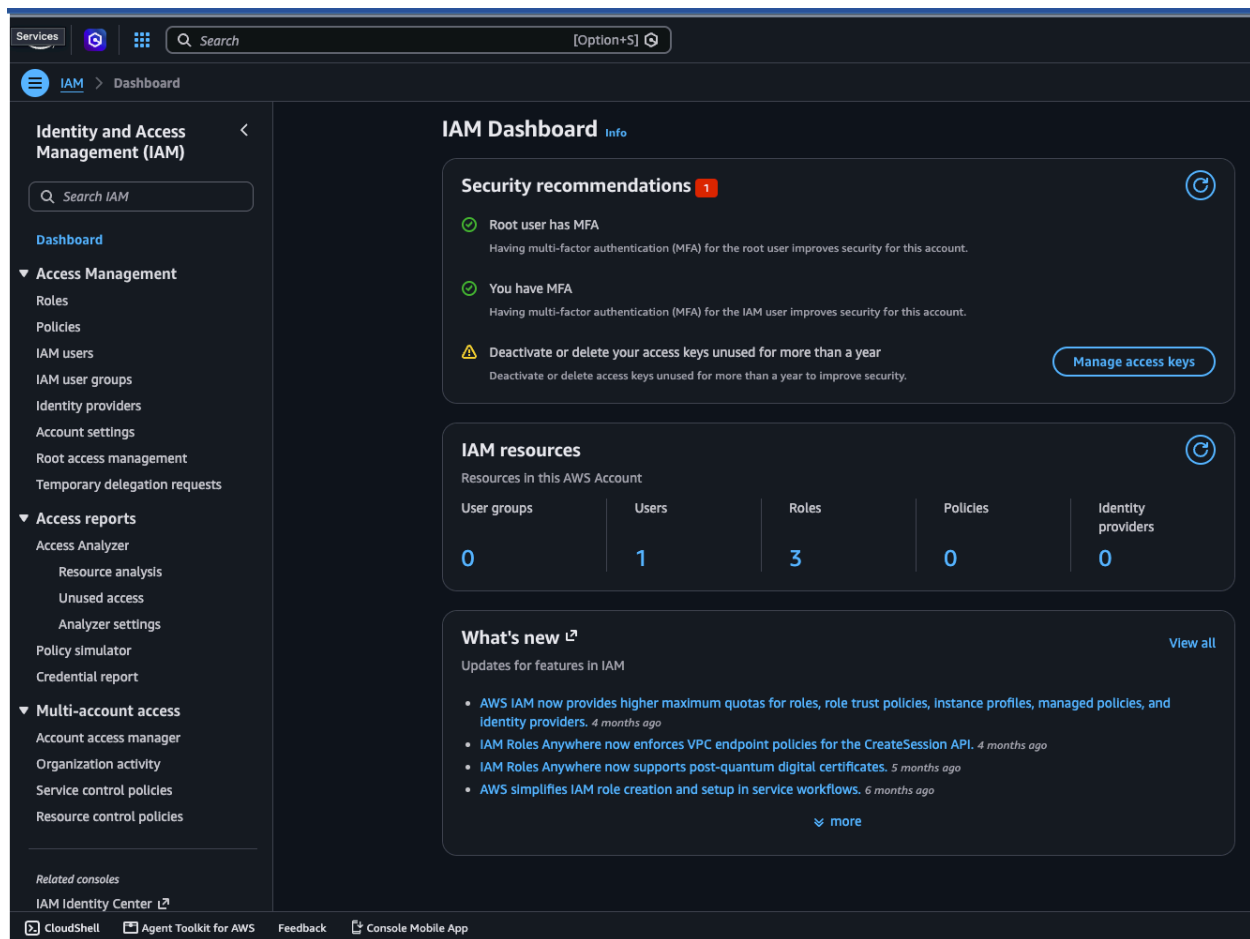

The screenshot displays the AWS IAM console interface. The browser address bar shows the URL: `us-east-1.console.aws.amazon.com/iam/home?region=us-east-2#/users`. The left-hand navigation pane is titled "Identity and Access Management (IAM)" and includes a search bar labeled "Search IAM". Below the search bar, the navigation menu is organized into sections: "Dashboard", "Access Management" (containing Roles, Policies, IAM users, IAM user groups, Identity providers, Account settings, Root access management, and Temporary delegation requests), "Access reports" (containing Access Analyzer with sub-items Resource analysis, Unused access, and Analyzer settings, Policy simulator, and Credential report), and "Multi-account access" (containing Account access manager, Organization activity, Service control policies, and Resource control policies). At the bottom of the navigation pane, there is a "Related consoles" section with a link to "IAM Identity Center".

The main content area is titled "IAM users (1)" with an "Info" link. Below the title, a descriptive text states: "An IAM user is an Identity with long-term credentials that is used to interact with AWS in an account." A search bar labeled "Search" is positioned below the text. The main area contains a table with the following columns: ☐ (checkbox), User name, Path, Group, Last activity, MFA, Password age, Console last sign-in, and Actions. A single user is listed in the table:

☐	User name	Path	Group	Last activity	MFA	Password age	Console last sign-in	Actions
☐	sulaiman-kaleel	/	0	4 minutes ago	Virtual...	30 minutes	4 minutes ago	-

The footer of the console includes links for "CloudShell", "Agent Toolkit for AWS", "Feedback", and "Console Mobile App", along with the copyright notice "© 2026, Amazon Web Services, Inc. or its affiliates. All rights reserved."

4. Access key

If you lose or forget your secret access key, you cannot retrieve it. Instead, create a new access key and make the old key inactive.

Access key

AKIA*****UBID

MFA and least-privilege IAM users matter for cloud security since it protects the root account from being hacked or accessed unknowingly. Having MFA makes it so the user will have to have a second form of identification to go through such as the authenticator app set up. Having a least privilege IAM user in this case is a good practice because in a case that login info was found, the attack would have a smaller effect since the user they log into doesn't have a lot of permissions. Another aspect of it is that it allows to have a control over what users can do certain tasks and change certain information.
