

Sulaiman Kaleel – Step 3 AWS_CLI_GitHub_Container_Setup

```
[root@c75863f757b0:/# aws --version
aws-cli/2.36.40 Python/3.14.6 Linux/7.0.12-linuxkit exe/aarch64.ubuntu.22
root@c75863f757b0:/# █
```

```
[root@c75863f757b0:/# aws sts get-caller-identity
{
  "UserId": "AIDAYSOCHKYMEB43AQYDQ",
  "Account": "589354718744",
  "Arn": "arn:aws:iam::589354718744:user/sulaiman-kaleel"
}
root@c75863f757b0:/# █
```

```
[root@c75863f757b0:/# git config --global --list
user.name=Sulaiman Kaleel
user.email=skaleel@hawk.illinoistech.edu
root@c75863f757b0:/# █
```

Both AWS credentials and GitHub tokens should never be committed to a repo because it is sensitive information that can give access to accounts. It acts as a password, and if found by someone not authorized they can login and make changes that can alter data and cost money. Even with private repos there is a chance of becoming public or accessed by a unauthorized user aswell.
